We identified 3,994 mother child dyads that met the criteria of a singleton births and pregnancy complications and the covariates of socio-economic and demographic characteristics. Model 1 examines the association between developing one pregnancy risk factor and the child's health outcomes. This analysis posed the question of whether having preterm babies (odds ratio=2.328). Finally, Model 4 shows that having two or more risk factors, even while controlling for the socio-economic and demographic characteristics. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit. The four models control for the following socio-economic and demographic characteristics: race-ethnicity, marital status, education level during pregnancy, and annual household income as reported during the prenatal care visit.
